- Low output and infeed height and therefore pitless integration into available systems.
- Integration as continuous turnover in systems possible. The stack comes in on a roller conveyor, is revolved and runs automatically out again.
- Alternative construction as individually positioned turnover in which the stack is put in by fork lift truck over the length and removed after revolving.
- Turnover design per customer requirements.
- Highly versatile in stack size and height, thus ensuring high flexibility.
- Adjustable side rail to avoid gliding.
- Fast commissioning because the turnover is supplied in one unit and ready for installation.
- Competitively priced due to standardized components.
